THINK STACK

Compliance

There are many components that go into cybersecurity and IT compliance for credit unions including vulnerability scans and testing, data loss prevention, and patch management. Think|Stack is readily available to assist credit unions with these needs. Think|Stack built our practice putting secure design principles, industry best practices, and regulatory compliance requirements first. Achieving our SOC 2 Type II certification proves our systems and processes are designed to help keep our clients' data and systems secure and aligned with the NIST cybersecurity and FFIEC frameworks.

Key Benefits

1. Internal scans detect and identify gaps or holes in your credit union network.

2. External scans cross reference IP addresses from the internet against public facing resources including firewalls, web servers, switches, and routers.

3. Data loss prevention protects your business against cyber-threats and safeguards sensitive information.

4. Patch management helps protect credit unions against sensitive member information getting breached.
